Modified differential, rear axle 1030

From the point of view of improving quality, we have introduced from week 7, 1970, a modified differential on the subject rear axle.

The modification gives better tooth contact, and this makes for better function both from the viewpoint of noise and wear. In appearance the gears are similar, but they cannot be used for individual replacement of the older gears. For purposes of identification, the new gears will be provided with a machined slit during a period of about one year.

Only the new gears will be stocked in future. They are sold only in kits, part No. 273224.
